

TITLE

*BioRTC/Simons Computational
Neuroscience Program 2026*

Damaturu, 26/06/2026

YOUR NAMES

- **Don't put too much text:** Slides support your talk. Don't read from your slides. 😊
- **Keep slides minimal:** Before adding anything to a slide, ask yourself if it helps you make your point. If not, remove it.
- **One slide, one message:** Each slide should have a single key takeaway.
- **Titles:** Make meaningful slide titles (usually statements)
- **Make sure it's readable:** Use large fonts, high contrast, and simple figures. The people seated in the back need to be able to read it.

- Open with the **big picture**: why does this area of research matter to society, science, or practice?
- **Narrow the scope**: guide the audience from the big picture down to the specific gap or problem your research addresses.
- **State the concrete research question** clearly and explicitly. Put it (or them if it's two) on a separate slide.
- **Motivate the question**: explain what makes it scientifically interesting or practically relevant. What would we gain from answering it?

Ca. 3 min

- **Experimental setup:** Describe the experimental setup. Explain why this setup is appropriate for answering the research question.
- **Groups:** If there are multiple conditions or groups, explain the logic behind them.
- **Data collected:** Describe what kind of data the setup produces.
- Make sure it is clear how this setup and data will actually allow you to answer the research question!

Ca. 4 min

- **Focus on the key findings:** Present only the results that directly address the research question. Don't show every result or figure. It is better to focus on a few and bring those across clearly. 😊
- **Walk through each finding clearly:** For each result, explain what the audience is looking at, what the key takeaway is, and why it matters.
- **Visuals:** Use drawings, schematics, etc.
- Prefer clean, simple plots over dense tables. Simplify figures if needed.

Ca. 5 min

- **Interpret the findings:** Explain what they mean. What do they tell us about the research question we stated at the beginning? What is the biological explanation?
- **Conclusions:** What are the main conclusions?
- **Mention limitations:** Briefly mention the key limitations of your study.
- **Future work:** What questions remain open?
- **Close with a take-home message:** End with one clear sentence that summarises what the audience should remember from your talk.

Ca. 3 min

- **Acknowledgement**
